DINOSAUR SKELETON

Allosaurus fragilis

CAPTURING THE DRAMA OF
140 MILLION YEARS AGO, the
fierce predator of the Jurassic
comes to life in this remarkable 9
inch scaled model,

adapted from the American Museum of Natural History's new exhibit in the Rotunda. It is one of the official commemorative scale models celebrating this event. It is designed anatomically accurate after the 26 ft. long original specimen now on exhibit. Cast in solid bronze in limited editions, this decorative and educational model is destined to be a highly prized collectible. Each bronze comes complete with certificate of authenticity.

Allosaurus fragilis

The Allosaurus is a fierce meat-eating predator, related to the vicious Tyrannosaurus rex, who lived over 140 million years ago. With neck craned and body low to the ground, the running Allosaurus readies itself to lunge at its prey. This bronze model is based on the mounted skeleton at the American Museum of Natural History in New York City, which depicts a fifty foot mother Barosaurus rearing up on her hind legs to protect her baby from Allosaurus.

Barosaurus lentus

The giant Barosaurus belongs to a group of immense plant-eating dinosaurs, the saur-pods, which includes the largest ever to have roamed the land. The adult Barosaurus is portrayed here, rearing up on her hind legs to defend her baby against an attacking Allosaurus. She is at the point of dropping down on top of the Allosaurus in an attempt to crush it.

This commemorative bronze model is based on the mounted skeleton at the American Museum of Natural History in New York City.

American Museum Bronze Collection

This commemorative dinosaur collection is available in limited editions and comes complete with certificate of authenticity. Each scale model is cast in solid bronze and was sculpted under the guidance of the Department of Vertebrate Paleontology, American Museum of Natural History.
